McReg Analytics

"We are speed. We are McReg. KAAA-CHOW!"

FOR GAME STUDIOS AND PUBLISHERS

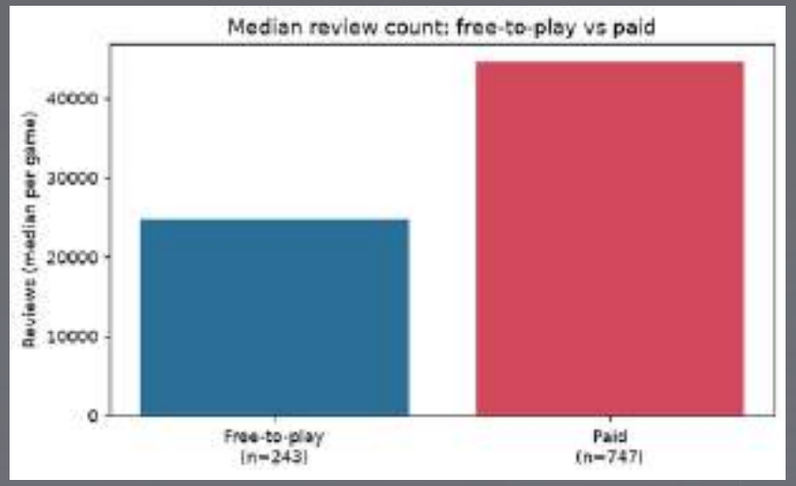

STEAMSCOPE: A WEB-BASED BUSINESS INTELLIGENCE DASHBOARD FOR ESTIMATING AND ANALYZING GAME SALES ON STEAM

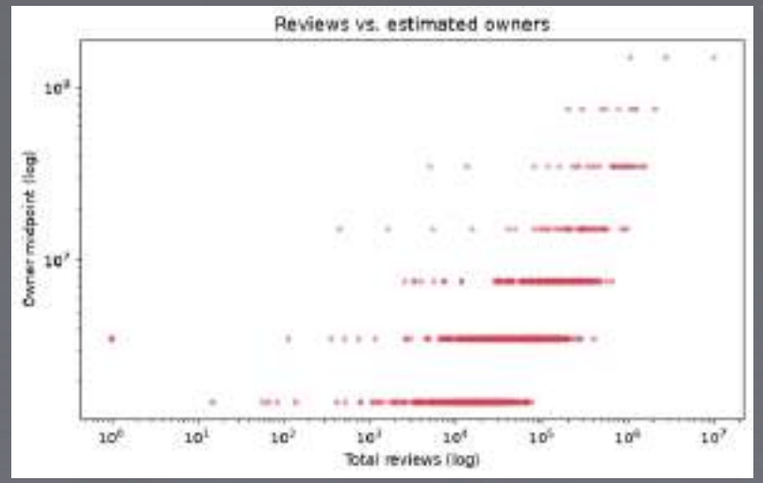

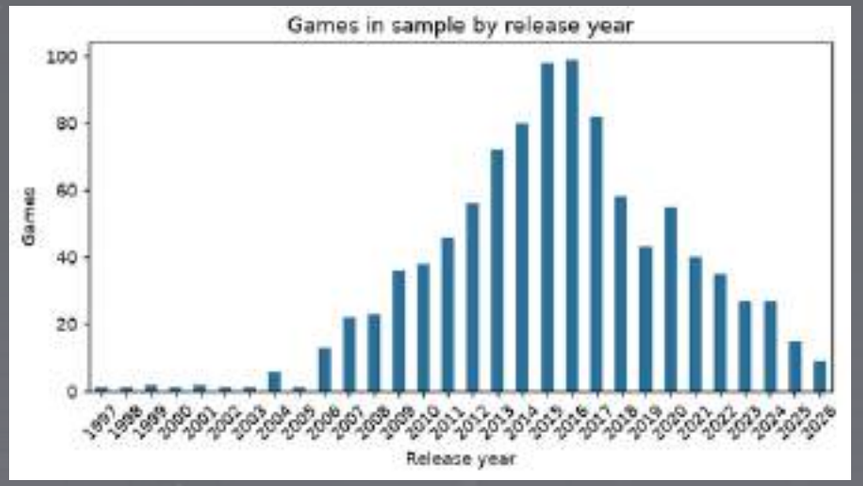

FAQs

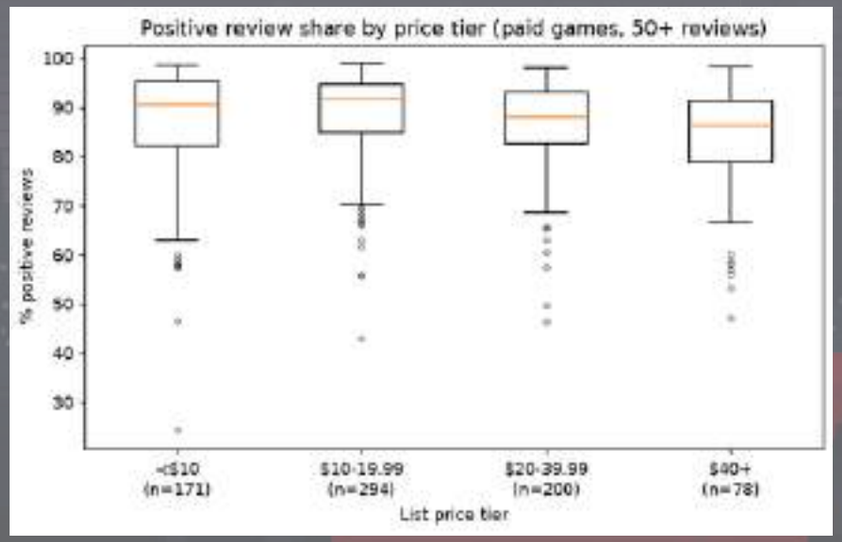

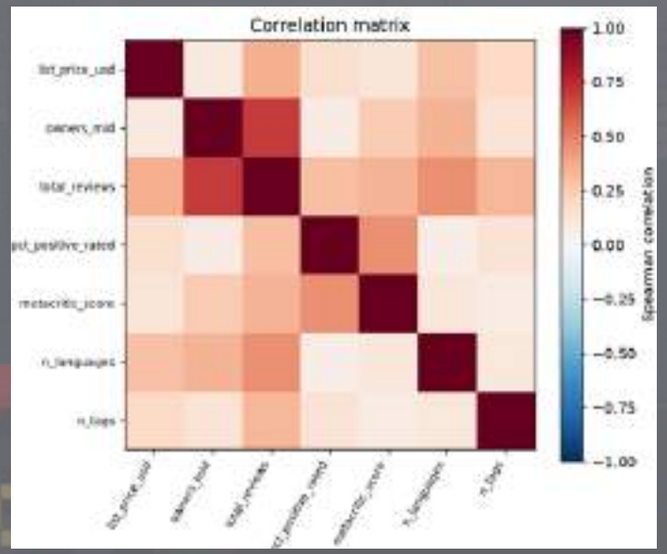

Executive Overview

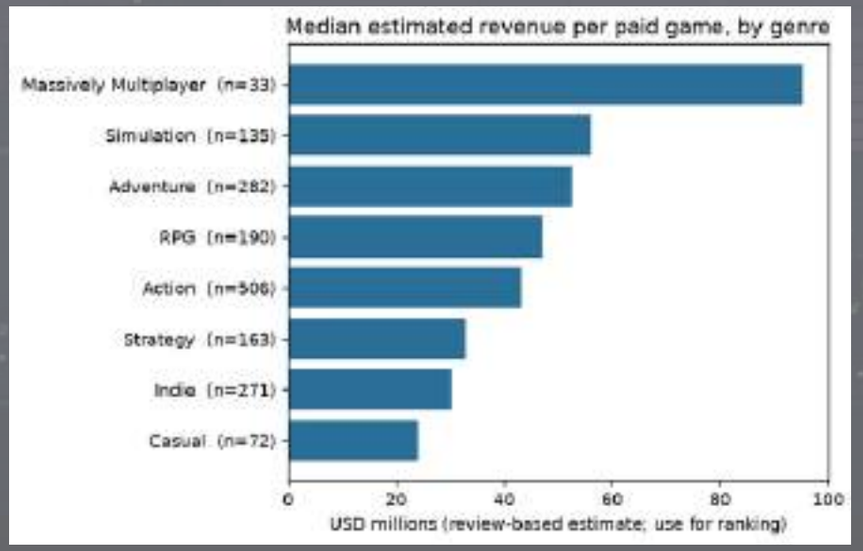

Analytics Platform

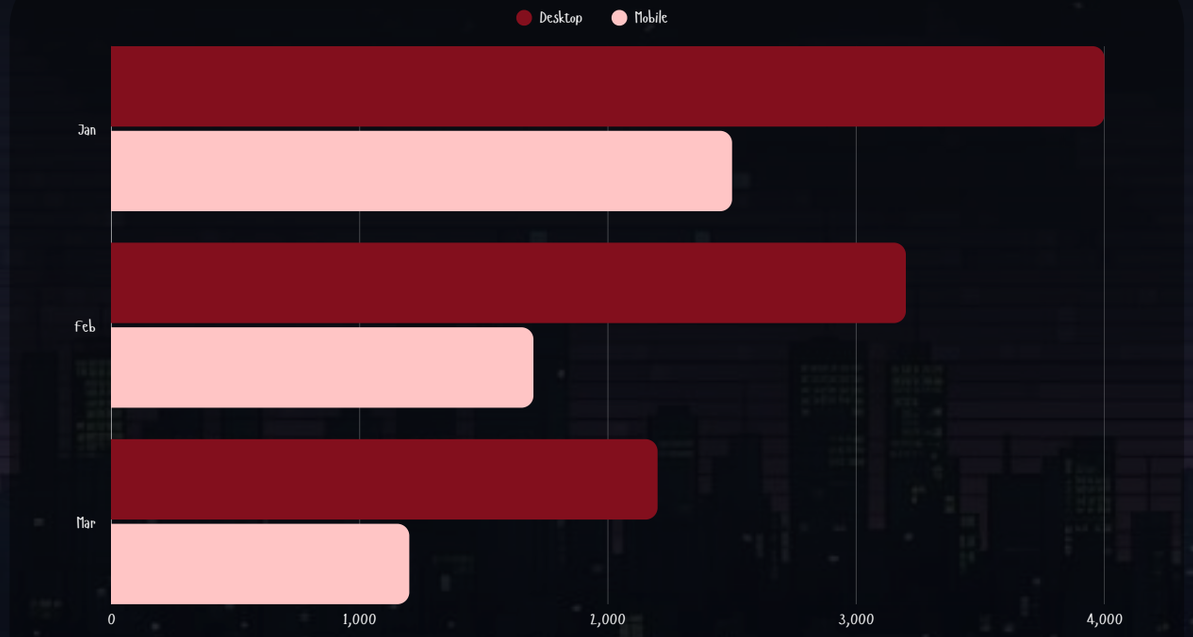

Tabs or sub-pages work well here:

- Revenue and pricing: revenue by genre, revenue by price tier, price vs rating
- Market trends: games released by year, platform support (Windows/Mac/Linux)
- Engagement: reviews vs owners, free vs paid owners, correlation heatmap
- Filters: genre, year, price range, free/paid

Data and Methodology

Four public endpoints supply the data each covering something the others lack. None requires an API Key.

- SteamSpy
  - Endpoint: streamspy.com/api.php
  - It provides the games list, owner estimate ranges, user tags, concurrent players (SteamSpy's playtime fields are no longer populated, so playtime is not used)
- Steam Store API
  - Endpoint: store.steampowered.com/api/appdetails
  - It provides the genres, developers, publishers, platforms, languages, system requirements, screenshots, DLC, age ratings, prices in 6 countries
- Steam Reviews API
  - Endpoint:store.steampowered.com/appreviews
  - It provides the review summary (positive and negative count scores) and a sample of up to 50 individual reviews per game
- Steam Web API
  - api.steampowered.com
  - It provides the percentage of players who unlocked each achievement
  - Prices that were collected here were for the US, UK, Germany, Japan, Philippines and Brazil, each in their corresponding local currency.

Step	Rows Before	Rows After	Why
Keep games with Store data	2,000	1,006	954 were never scraped and there were 40 apps that returned nothing from the Store API (likely delisted)
Keep type = game	1,006	1,006	DLC, demos and software distort per-game sales; none were present
Drop unreleased or invalid release dates	1,006	990	A game that is not released has no sales
Keep the latest owner estimate per game	3,000	990	Removes duplicate snapshots and games dropped above; every remaining game has an owner estimate
Regional prices: valid games only	4,378	4,359	Removes prices of dropped games; no price was invalid
Sampled reviews: remove duplicates and orphans	40,692	40,232	Removes repeated reviews and reviews of dropped games
Samples reviews: remove empty text	40,232	40,208	Empty reviews cannot be analyzed
Ratings only for games with 50+ reviews	990	986	Percentages from very few reviews are too noisy; 4 games lose their rating but stay in the sales analysis

Data Cleaning

Five further rules shape the analysis:

- Free and paid games are separated. The sample has 747 paid and 243 free-to-play games. Free games earn through in-game purchases that the data cannot see, so their revenue is left blank (not zero) and they are compared on reviews, owners and ratings instead.
- Outliers are flagged, not removed. About 23% of games are outliers for owners, 8% for revenue and 10% for reviews. They are the biggest hits, so removing them would remove the main finding. We use medians and log scales.
- Missing values are left blank. Metacritic scores are missing for 39.6% of games and are not filled in.
- All genres are kept. A game can have several genres, and Steam lists Action first for most, so using only the first genre would make Action look like 70% of the market.
- Unusable fields are excluded. SteamSpy no longer returns playtime (it is 0 for every game) and caps tags at 20, so neither is used.

Estimating Sales

Steam does not publish unit sales, so all sales and revenue figures in this project are estimates built from public proxies.

- Estimated units (owners): the midpoint of SteamSpy's owner range for each game.
- Estimated units (reviews): total reviews multiplied by 40, a commonly cited rule of thumb that ranges from about 30 to 50. We show it as a second, independent estimate.
- Estimated gross revenue: estimated units from owners multiplied by the US list price. (Add the owners min and max then divide it by 2 then multiply to the list price in USD)
- These revenue figures are gross: they ignore discounts, refunds, regional price differences, and Steam's revenue share, so they overstate real earnings. They are just for ranking and comparing games, genres, and publishers, not for reporting absolute dollars.

About us

McReg Analytics is a data analytics company based in Ortigas, Pasig City, offering swift, efficient services to customers and striving to create a bigger, brighter future. Our company guarantees professional, reliable services by transforming raw data into useful information that enables smarter decision-making. McReg Analytics assures customers that its team is highly competent, qualified, and dedicated to providing precise analytics. In addition, the company aims to assure customers that all information shared with McReg Analytics will be handled with the utmost discretion and confidentiality, processed securely, and used only for its intended purpose

About this project

McReg Analytics began with a simple mission: to bring order to data and to fully accomplish projects to ensure we get good grades in our academic requirements. But for actual further context, our team was first founded to oversee the records of a car registration company. There, we learned how to manage large volumes of structured data with care. McReg Analytics then turned to Adventure Works Cycles, a bicycle manufacturer and retailer. Starting from nothing but raw tables, we built complete dashboards that turned scattered transactions into clear insight on sales, products, and customers. Each project sharpened the same core craft. We collect raw data, shape it into a sound relational model, and present it in a form decision makers can trust. Having proven that craft in automotive and retail, we are now expanding our horizons into one of the most dynamic industries in the world: video games.

Gaming now earns more than film and music combined (Culture Correspondent, 2026), and Steam stands at the heart of PC gaming. It is home to tens of thousands of titles and millions of players every single day. Yet behind this storefront lies a surprising gap. Steam does not publish how many copies a game sells or how much it earns. There may be written reports or articles surrounding multiple popular gaming companies across owner estimates, prices, genres, reviews, and achievements. However, there is no single source that brings them together.

This project is our answer to that gap. Using only publicly available data, we apply the full Data Science pipeline that McReg Analytics has typically used to Steam. We will be gathering data, cleaning, making dashboards for visualizations, and interpret findings revealing what drives a game's success.
